

MaiaEdge Architecture for CENTRA — Key Properties

- Redundant MaiaEdge PBCs and Port Extenders at every CENTRA site
- Redundant DIAs (DIA-1 / DIA-2) provide diverse, encrypted L2 mesh paths between all sites
- Termination of carrier fibers into MaiaEdge PBCs serving as a software-defined MMR with automated, dynamic cross-connect functionality
- Encrypted and authenticated L2 paths at line rate over both wave and DIA underlays
- Charlotte datacenter is the Equinix Fabric hub providing cloud onramp services to AWS, Azure, GCP, and SaaS / partner providers
- Dedicated waves connect Portland, Reno-1, and Reno-2 to the Charlotte hub for premium, deterministic transport
- Minneapolis joins the same fabric without dedicated fiber — DIA mesh extends every service, including cloud onramp, to sites where waves are not yet available
- End-to-end service visibility for CENTRA and its tenants — every customer service is observable path-by-path and hop-by-hop, eliminating colo / carrier / customer finger-pointing
- Advertise and sell cross-site connectivity and cloud onramp services to customers and partner providers in the MaiaEdge Marketplace
