

INTRO / WHO WE ARE / WHY US WITH SERVICE FABRIC

What MaiaEdge Is. Why It Belongs Beside Service Fabric.

MaiaEdge is carrier infrastructure for the network-edge layer that sits beyond a colocation facility. A 1RU Path Border Controller (PBC) deploys at a partner network's boundary; a cloud Path Computation Engine (PCE) orchestrates centrally. Together they extend the same deterministic, controller-driven, virtual-link semantics Service Fabric uses inside DR facilities onto the partner-network leg.

01 THE FACILITY-EDGE GAP IS A FABRIC GAP

Service Fabric ends at the facility door. So does the deterministic path.

Service Fabric covers DR's 130+ facilities and the 350+ third-party data centers it already reaches. Beyond that footprint, deterministic Ethernet dissolves into best-effort transit and 60-to-90 day partner turn-ups.

MaiaEdge carries Service-Fabric-style semantics, virtual links, tagging, controller-driven activation, hop-by-hop telemetry, onto the partner-network leg, so the same path experience reaches metros DR has not built.

02 AI INFERENCE IS DECENTRALIZING

Hyper-scale training stays put. Inference is moving outward.

Training stays in DR's gigawatt campuses. Inference is moving into tier 2 colos, regional fiber networks, and enterprise edge sites where deterministic latency matters more than raw FLOPs.

The partner-network leg rides fiber or DIA, so instant NNIs become deployable in minutes with any carrier or Ethernet metro outside the DR footprint. Service Fabric handles the spine; MaiaEdge handles the last 50 miles.

03 PARTNER-FIRST BY DESIGN

Service Fabric is the anchor. MaiaEdge is the branch.

MaiaEdge plugs into open fabrics, not against them. No reselling, no owned circuits, no wedge between DR and the customer.

Same controller-to-controller pattern DR already runs with partners: a DR customer extends a virtual link onto a MaiaEdge-managed PBC, with DR keeping the customer, the brand, and the margin.

ARCHITECTURE AT A GLANCE

PBC / PATH BORDER CONTROLLER

1RU at the partner-network boundary. Dual 100G. Line-rate AES-256-GCM. Sub-2 microsecond forwarding. No protocols in the field.

PATH ACTIVATION / ZERO-TOUCH

Rack the PBC, claim it in the PCE. Customer paths activate over fiber or DIA in minutes. Instant NNIs, no truck rolls.

PCE / PATH COMPUTATION ENGINE

Cloud orchestrator. Central path computation, hop-by-hop telemetry, multi-tenant isolation, API-first.

FABRIC EXTENSION / OPEN BY DESIGN

First integration target: Service Fabric controller-to-controller, so DR keeps the customer and the brand.
