

ITW 2026 / PRE-READ FOR DR

Extending Service Fabric Reach for AI Inference.

Service Fabric covers 130+ DLR facilities and 350+ third-party data centers via Megaport and Console Connect. The next gap your customers describe, and the one Rick Gaeta surfaced on our 4/6 call, is what happens once that path leaves the facility edge. MaiaEdge extends Service Fabric's deterministic reach onto local fiber, network operators, and partner facilities in tier 2/3/4 markets where DLR has no native presence today.

01 DETERMINISM GAP

The "last 50 miles" problem.

Network operators are increasingly being asked to deliver bounded latency and loss for AI inference traffic that originates on Service Fabric but terminates on a partner network. There is no parity for that path today.

MaiaEdge's Path Border Controller (PBC) extends Service Fabric semantics: virtual links, Q-in-Q tagging, controller-driven activation, onto local fiber and Ethernet at the edge so the partner-network leg behaves like an on-fabric leg.

02 TIER 2/3/4 REACH EXTENSION

Carrier-grade on-ramps where DLR has no facility.

Federal infrastructure investment and AI inference distribution are driving demand for deterministic connectivity into markets well below the DLR footprint.

Because the partner-network leg rides fiber or DIA, instant NNIs become deployable in minutes with any carrier or Ethernet metro outside the DR footprint. We pitched the Arvig (greater Minneapolis) model on 4/6 as one example. The same pattern works in dozens of secondary metros without DR building a facility.

03 PLATFORM INTEGRATION ASK

API parity with the existing fabric integrations.

MaiaEdge already speaks the Equinix Fabric and Megaport APIs in production. The technical request is the equivalent integration pattern with Service Fabric: a controller-to-controller integration that lets Service Fabric customers extend a virtual link onto a MaiaEdge-managed PBC on-ramp the way they extend onto Megaport today. No new product, no new commercial construct on day one.

THE ITW ASK

30 minutes with Travis at the show.

Follow-on with Chris Sharp's office post-show.

We are not asking DLR to build, productize, or co-sell at this stage. The question we want to test at platform level: is deterministic Service Fabric reach beyond the facility edge on the three-year roadmap, and where does an integration like MaiaEdge fit?
