1. EXECUTIVE SUMMARY

1.1 Introduction

This Fiber & Interconnection Strategy establishes the framework by which the Nexus Data Center Hubbard (Nexus Hubbard) campus will be positioned as a nationally significant telecommunications hub and Internet Exchange Point (IXP). This strategy defines how fiber infrastructure, carrier engagement, backbone routing, and interconnection architecture collectively support the long-term scalability, reliability, and commercial success of the Nexus hyperscale and Neocloud campus.

At full buildout, the Nexus Hubbard campus will aggregate approximately 11,600 fiber strands, placing it among the most fiber-dense interconnection environments in the United States. This level of aggregation positions Nexus Hubbard as a Tier 1 hyperscale interconnection node, comparable in scale to legacy hubs such as Ashburn, Virginia, while benefiting from greenfield development, Texas-scale power availability, and direct adjacency to large-scale AI compute.

1.2 Strategic Function

This fiber strategy is foundational for the Nexus Hubbard campus Infrastructure. All data traffic to and from hyperscale AI buildings, Neocloud facilities, and enterprise tenants traverses this fiber ecosystem. The strategy is designed to:

- Establish Nexus Hubbard as a regional, national, and international traffic aggregation point
- Enable dense private peering and Internet Exchange operations
- Support AI-driven east–west and north–south traffic flows
- Create durable, recurring revenue streams through interconnection services

The fiber network and Carrier Hotel together function as the network gravity center of the campus, where each additional carrier or tenant increases the value of the platform for all participants.

1.3 Purpose of Document

This document consolidates national IXP benchmarking data, campus-specific fiber architecture, and carrier engagement planning into a single cohesive strategy. It is intended to guide:

- Carrier engagement and contracting
- Backbone fiber design and phasing
- Interconnection and peering architecture
- Regulatory and permitting alignment
- Long-term commercialization planning

2. NATIONAL IXP LANDSCAPE & BENCHMARKING

2.1 Overview of U.S. Internet Exchange Infrastructure

The United States hosts approximately 74 meaningful Internet Exchange Points and carrier interconnection hubs, ranging from Tier 1 hyperscale nodes to small regional exchanges. While many facilities operate with modest fiber counts, a small number of hubs dominate national and international traffic aggregation.

Across all U.S. IXPs, estimated total fiber aggregation is approximately 192,450 strands, with an average of ~2,600 strands per exchange. Only a limited number of facilities exceed 7,000 strands, and fewer still approach or exceed 10,000 strands.

US Internet Exchange Points - Summary Statistics			
Category	Count	Total Est. Fiber Strands	Avg Strands
Tier 1 Hyperscale	1	11,600	11,600
Tier 1	9	74,500	8,278
Large	12	50,800	4,233
Medium	21	40,200	1,914
Regional	18	12,080	671
Small	13	3,270	252
TOTAL	74	192,450	2,601
Nexus Hubbard Comparison			
Nexus Hubbard Fiber Strands	11,600		
% of All US IXP Fiber (Est.)	6.03		
Rank Among US IXPs	2		

Figure 2-1: U.S. Internet Exchange Points by Capacity Tier and Estimated Fiber Aggregation

2.2 Nexus Hubbard Comparative Position

The Nexus Hubbard campus is designed to aggregate approximately 11,600 fiber strands, representing roughly 6% of all estimated U.S. IXP fiber capacity. Based on estimated fiber counts, Nexus Hubbard ranks second nationally among U.S. IXPs, exceeded only by Ashburn, Virginia.

This positioning places Nexus Hubbard firmly within the Tier 1 Hyperscale IXP category, despite its location outside legacy coastal or Tier 1 metro markets.

IXP Name	City	State	Operator/Type	Est. Fiber Strands	Capacity Tier	Notes
Nexus Hubbard	Hubbard	TX	Hyperscale Campus	11,600	Tier 1 Hyperscale	7+ GW AI data center campus with massive fiber infrastructure
Equinix IX Ashburn	Ashburn	VA	Equinix	12,000	Tier 1	Largest US peering hub
DE-CIX New York	New York	NY	DE-CIX	9,500	Tier 1	Major international gateway
AMS-IX New York	New York	NY	AMS-IX	8,500	Tier 1	European operator
CoreSite Any2 Los Angeles	Los Angeles	CA	CoreSite	8,200	Tier 1	Primary West Coast hub
Equinix IX Dallas	Dallas	TX	Equinix	7,800	Tier 1	Central US hub
CoreSite Any2 Chicago	Chicago	IL	CoreSite	7,500	Tier 1	Midwest backbone
NYIIX	New York	NY	Telehouse	7,200	Tier 1	New York Internet eXchange
Equinix IX Silicon Valley	San Jose	CA	Equinix	7,000	Tier 1	Tech sector hub
NAP of the Americas	Miami	FL	Equinix	6,800	Tier 1	Latin America gateway
SIX (Seattle)	Seattle	WA	SIX	5,500	Large	Pacific Northwest hub
LINX NoVA	Ashburn	VA	LINX	5,200	Large	London Internet Exchange NoVA
AMS-IX Bay Area	San Jose	CA	AMS-IX	5,000	Large	Bay Area presence
DE-CIX Dallas	Dallas	TX	DE-CIX	4,800	Large	Texas expansion
AMS-IX Chicago	Chicago	IL	AMS-IX	4,600	Large	Midwest presence
MiamiIX	Miami	FL	MiamiIX	4,200	Large	Regional exchange
SFMIX	San Francisco	CA	SFMIX	4,000	Large	San Francisco Metro IX

3. CAMPUS INTERCONNECTION ARCHITECTURE

3.1 Role of the Nexus Carrier Hotel

The Nexus Carrier Hotel is the physical and operational core of the campus fiber strategy. It serves as:

- The primary Meet-Me Room (MMR) complex
- The campus Internet Exchange Point
- The aggregation node for long-haul, regional, and metro fiber
- The demarcation point between external networks and internal campus distribution

All external carrier connectivity and all internal campus fiber distribution converge at this facility.

Figure 3-1: Nexus Hubbard Campus – Carrier Hotel as Network Gravity Center

3.2 Carrier Hotel Capacity Alignment

The Carrier Hotel is designed to support:

- Approximately 11,600 aggregated fiber strands
- More than 12 major carrier networks at initial maturity
- Hundreds of additional enterprise, cloud, and content networks over time
- Private peering, public peering, and cross-connect services

The building's Meet-Me Room configuration, pathway density, and security architecture are intentionally designed to support sustained interconnection growth without requiring structural reconfiguration.

4. BACKBONE FIBER STRATEGY

4.1 Regional Backbone Design

Nexus is developing a radially diverse backbone fiber network extending from the Carrier Hotel to four regional connection points:

- Waco
- Corsicana
- Hillsboro
- Hubbard

These routes are designed to intersect existing long-haul carrier infrastructure and provide multiple paths into major Texas metro markets, including Dallas–Fort Worth, Houston, San Antonio, Austin, and the rest of the USA.

Figure 4-1: Regional Backbone Fiber Routes from Nexus Carrier Hotel

4.2 Fiber and Conduit Configuration

Each backbone route is designed with 2,880 fibers, delivered via a multi-duct conduit system that balances immediate capacity with long-term expansion flexibility.

Each route includes:

- One 7-way conduit populated with seven 288-count fiber cables
- One 1.25-inch conduit populated with one 864-count fiber cable
- One spare 7-way conduit
- One spare 1.25-inch conduit

Across all four routes, total backbone fiber delivered to the Carrier Hotel is approximately 11,520 fibers, aligning with the campus target aggregation of 11,600 strands.

4.3 Design Objectives

The backbone strategy is designed to achieve:

- Physical route diversity
- Carrier-neutral access
- Scalability without re-trenching
- Support for dark fiber, wavelength, and managed services
- Long-term right-of-way defensibility

5. CARRIER ENGAGEMENT STRATEGY

5.1 Engagement Status

Carrier engagement is structured to prioritize early anchor tenants while maintaining neutrality and long-term market openness. As of late 2025:

- NDAs have been executed with select national and regional carriers
- Additional NDAs are in progress with Tier 1 and Tier 2 providers
- Multiple carriers have confirmed interest contingent on route completion and Carrier Hotel commissioning

Priority	Carrier Company	Nexus NDA Executed? Yes / No / In Progress
1	Verizon (formerly GTE)	Yes
1	AT&T	Yes
1	Uniti Fiber	Yes

Priority	Carrier Company	Nexus NDA Executed? Yes / No / In Progress
1	Databank	Yes
1	Fidium (Consolidated Communications)	Yes
2	FiberLight	Yes
2	Zayo North America	Yes
2	Lumen	Yes
2	Flow Networks (redIT)	In Progress
2	Segra	Yes
2	Astound	Yes
2	NextLink	Yes

Figure 5-1: Carrier Engagement Status and NDA Progression

5.2 Carrier Neutrality

Nexus Hubbard is being developed as a fully carrier-neutral interconnection environment, with no exclusive access rights granted.

6. REGULATORY & PERMITTING ALIGNMENT

6.1 Telecommunications Regulatory Strategy

To support this vertically integrated fiber model, Nexus Data Centers, LLC is pursuing designation as a Competitive Local Exchange Carrier (CLEC) and a Service Provider Certificate of Operating Authority (SPCOA).

7. INTEGRATION WITH AI & NEO-CLOUD COMPUTE

7.1 Compute-Driven Fiber Demand

The Nexus Hubbard campus is designed to support multi-gigawatt AI and HPC compute deployment, driving extreme east–west traffic volumes and dense private peering requirements.

8. STRATEGIC OUTCOMES

8.1 Network Effects

Each incremental carrier, cloud provider, or content network increases the value of the platform for all participants.

8.2 Long-Term Monetization

The fiber and interconnection platform supports multiple durable revenue streams, including cross-connect services, carrier cage leasing, IX participation, and dark fiber and wavelength offerings.

9. CONCLUSION

The Nexus Hubbard Fiber & Interconnection Strategy is a foundational element of the campus's long-term success. By aggregating approximately 11,600 fiber strands into a purpose-built, AI-adjacent interconnection environment, Nexus Hubbard is positioned not merely as a data center campus, but as core digital infrastructure.
